

This document describes how the Front End Test works

MAIN OBJECTIVES:

- To understand your natural approach when building a web page
- Test your responsive web building skills
- Test your SASS and GRUNT/GULP setup skills

TASKS:

- Based on the two visuals called DESKTOP & MOBILE, please convert the design into a fully functional HTML document.
- SASS should be used as your CSS preprocessor and a task runner such as GRUNT or GULP should be set up and include whatever tasks you feel are needed.
- No CSS library such as Bootstrap or Foundation should be used for this exercise.
- Comment your code where you feel necessary

TIPS:

- This is not a trick test. We understand that there are several ways of building a web page. We are looking at your approach and SASS/CSS techniques above all.
- No Javascript (or related libraries) should be used to achieve the conversion from design into html
- Pay attention to details for the Design when you convert into HTML.

DELIVERABLES:

- Upload a ZIP file into the folder called "YOUR OUTPUT" including your full and working dev stack - ie the Source and Distribution folders and files alongside the task runner configuration (e.g gruntfile.js)
- We expect to have this completed within 36 hours after you have been sent this document
